

WATER DAMAGE RESTORATION PROCESS

WATER DAMAGE INSPECTION

A technician will assess the source of water damage, evaluate contamination levels, and develop a restoration plan.

1

WATER EXTRACTION

Technicians use industrial-grade pumps to remove and redirect standing water from every affected area of your home.

2

CONTENTS REMOVAL

We carefully remove any flooring, wooden structures, or fixtures that are too damaged to salvage.

3

6

REPAIR (IF NECESSARY)

Your walls, cabinetry, and plumbing are repaired and reconstructed (if needed) to their pre-damage condition.

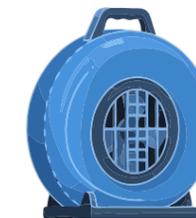

5

CLEANING AND SANITIZING

Technicians use specialized equipment and cleaning agents to eliminate airborne contaminants and restore healthy indoor air quality.

4

DRYING AND DEHUMIDIFYING

We deploy powerful air movers, fans, and dehumidifiers to draw moisture from and dry all water-affected surfaces.
